

GLOSSARY

Abduction: A movement away from the midline of the body, for example, moving your arm out to the side.

Acute: Refers to an injury with a sudden onset.

Adduction: A movement towards the midline of the body, for example, moving your arm towards the body during a pull-up.

Anterior: Front.

Campus board: A training device made up of a ladder of wooden rungs on an overhanging plywood wall.

Chronic: Refers to an injury related to overuse, which develops over time.

Concentric: The shortening of a muscle.

Crimp: Crimping involves an acute angle in the PIP joints, hyperextended DIP joints and the thumb placed over the index finger to lock the grip down.

Deadhang: A finger strength training method where you hang from the edges of a fingerboard or similar.

DIP joint: Distal interphalangeal joint. The outermost joint of the finger.

Distal: A part of the body that is farther away from the centre of the body than another part.

Dorsal: Back side. For example, the back, back of the hand, top of the foot. Dorsiflexion then implies movement towards the back side.

Eccentric: The lengthening of a muscle while it's contracting. Lengthening under tension.

Fingerboard: A board with a selection of edges and holds for training arm and finger strength.

Grip tool: A portable device to train finger strength (but can also be used to train other body areas as well).

Growth plate: The growth plate is the cartilaginous portion of long bones where the longitudinal growth of the bone takes place.

Half crimp: Grip position where the PIP joints are flexed at approximately 90 degrees.

Inflammation: A normal part of the body's response to injury or infection. Inflammation occurs when the body releases chemicals that trigger an immune response to fight off infection or heal damaged tissue.

Isometric: A static contraction.

Lateral: Outside.

Load: A broad term. In training it involves the total volume and intensity during an exercise, and involves both the external load (i.e. amount of kilograms lifted) and the internal load (i.e. how we respond to the training).

Load cell: A sensor that measures the mechanical force applied to the system.

MCP joint: Metacarpophalangeal joint. The joint at the base of the finger, where it meets the palm.

Medial: Inside.

No-hang: No-hang means, as the name suggests, that rather than hanging from the edges, you are standing on the ground and pressing your fingertips against a grip surface.

NSAIDs: Non-steroidal anti-inflammatory drugs – generally no longer recommended in the treatment of acute soft tissue injuries.

Open hand: All grip positions where the angle of the PIP joints is greater than 90 degrees.

Overcoming isometrics: Pushing, pulling or curling against a fixed object, trying to move it.

PIP joint: Proximal interphalangeal joint. The middle joint of the finger.

Posterior: Back.

Pronation: The rotation of the palm of the hand so the inner part faces down.

Proximal: A part of the body that is closer to the centre of the body than another part.

Rate of force development (RFD): A measure of how quickly a muscle can go from zero to maximum force and an important attribute of the muscles in the forearm for all kinds of climbing.

Relative Energy Deficiency in Sport (REDs): A condition of energy deficiency which causes adverse effects on all bodily systems.

Rotator cuff: A collection of four muscles – supraspinatus, subscapularis, infraspinatus and teres minor – with their associated tendons that attach as a cuff around the head of the upper arm at the shoulder.

Supination: The rotation of the palm so the inner part faces up.

Synovitis: Inflammation of the synovial membrane due to high stress within a joint.

Tendinopathy: Pain and dysfunction in a tendon, defined as a failed healing response of the tendon.

Tendonitis: Inflammation of a tendon.

Tenosynovitis: An inflammatory condition affecting the tendon sheath.

Volar: The palm side of the hand.
